

Programming Specifications for PIC16C7XX OTP MCUs

This document includes the programming specifications for the following devices:

- PIC16C717
- PIC16C770
- PIC16C771
- PIC16C781
- PIC16C782

1.0 PROGRAMMING THE PIC16C7XX

The PIC16C7XX can be programmed using a serial method. In Serial mode, the PIC16C7XX can be programmed while in the users system. This allows for increased design flexibility. This programming specification applies to PIC16C7XX devices in all packages.

1.1 Hardware Requirements

The PIC16C7XX requires two programmable power supplies, one for VDD (2.5V to 6.5V recommended) and one for VPP (12V to 14V). Both supplies should have a minimum resolution of 0.25V.

1.2 Programming Mode

The Programming mode for the PIC16C7XX allows programming of user program memory, special locations used for ID, and the configuration word for the PIC16C7XX.

PIC16C7XX

2.0 PROGRAM MODE ENTRY

2.1 User Program Memory Map

The user memory space extends from 0x0000 to 0x1FFF (8K). Table 2-1 shows actual implementation of program memory in the PIC16C7XX family.

TABLE 2-1: IMPLEMENTATION OF PROGRAM MEMORY IN THE PIC16C7XX

Device	Program Memory Size
PIC16C717	0x000 – 0x7FF (2K)
PIC16C770	0x000 – 0x7FF (2K)
PIC16C771	0x000 – 0xFFF (4K)
PIC16C781	0x000 – 0x3FF (1K)
PIC16C782	0x000 – 0x7FF (2K)

When the PC reaches the last location of the implemented program memory, it will wrap around and address a location within the physically implemented memory (see Figure 2-1).

In Programming mode, the program memory space extends from 0x0000 to 0x3FFF, with the first half (0x0000-0x1FFF) being user program memory and the second half (0x2000-0x3FFF) being configuration memory. The PC will increment from 0x0000 to 0x1FFF and wrap to 0x000, or 0x2000 to 0x3FFF and wrap around to 0x2000 (not to 0x0000). Once in configuration memory, the highest bit of the PC stays a '1', thus always pointing to the configuration memory. The only way to point to user program memory is to reset the part and reenter Program/Verify mode, as described in Section 2.2.

In the configuration memory space, 0x2000-0x207F or 0x2000-0x20FF are utilized. When in a configuration memory, as in the user memory, the 0x2000-0x2XFF segment is repeatedly accessed as PC exceeds 0x2XFF (Figure 2-1).

A user may store identification information (ID) in four ID locations. The User ID locations are mapped in [0x2000: 0x2003]. These locations read out normally even after the code protection is enabled.

Note 1: All other locations in PICmicro® MCU configuration memory are reserved and should not be programmed.

2: Only the low order 4 bits of the User ID locations may be included in the device checksum. See Section 3.3.1 for checksum calculation details.

PIC16C7XX

2.2 Program/Verify Mode

The Program/Verify mode is entered by holding pins RB6 and RB7 low, while raising $\overline{\text{MCLR}}$ pin from Vss to the appropriate VIHh (high voltage). VDD is then raised from Vss to the appropriate VDD level. Once in this mode, the user program memory and the configuration memory can be accessed and programmed in serial fashion. The mode of operation is serial, and the memory that is accessed is the user program memory. RB6 is a Schmitt Trigger input in this mode.

The sequence that enters the device into the Programming/Verify mode, places all other logic into the RESET state (the $\overline{\text{MCLR}}$ pin was initially at Vss). This means that all I/O are in the RESET state (high impedance inputs).

Note 1: The $\overline{\text{MCLR}}$ pin should be raised as quickly as possible from VIL to VIHh. This is to ensure that the device does not have the PC incremented while in valid operation range.

2: The $\overline{\text{MCLR}}$ pin must be raised from VIL to VIHh before VDD is applied. This is to ensure that the device does not have the PC incremented while in valid operation range.

2.2.1 PROGRAM/VERIFY OPERATION

The RB6 pin is used as a clock input pin, and the RB7 pin is used for entering command bits and data input/output during serial operation. To input a command, the clock pin (RB6) is cycled six times. Each command bit is latched on the falling edge of the clock, with the Least Significant bit (LSb) of the command being input first. The data on pin RB7 is required to have a minimum

setup and hold time (see AC/DC specs), with respect to the falling edge of the clock. Commands that have data associated with them (read and load) are specified to have a minimum delay of 1 μs between the command and the data. After this delay, the clock pin is cycled 16 times, with the first cycle being a START bit and the last cycle being a STOP bit. Data is also input and output LSb first. Therefore, during a read operation, the LSb will be transmitted onto pin RB7 on the rising edge of the second cycle, and during a load operation, the LSb will be latched on the falling edge of the second cycle. A minimum 1 μs delay is also specified between consecutive commands.

All commands are transmitted LSb first. Data words are also transmitted LSb first. The data is transmitted on the rising edge and latched on the falling edge of the clock. To allow for decoding of commands and reversal of data pin configuration, a time separation of at least 1 μs is required between a command and a data word (or another command).

The commands that are available are listed in Table 2-2.

2.2.1.1 Load Configuration

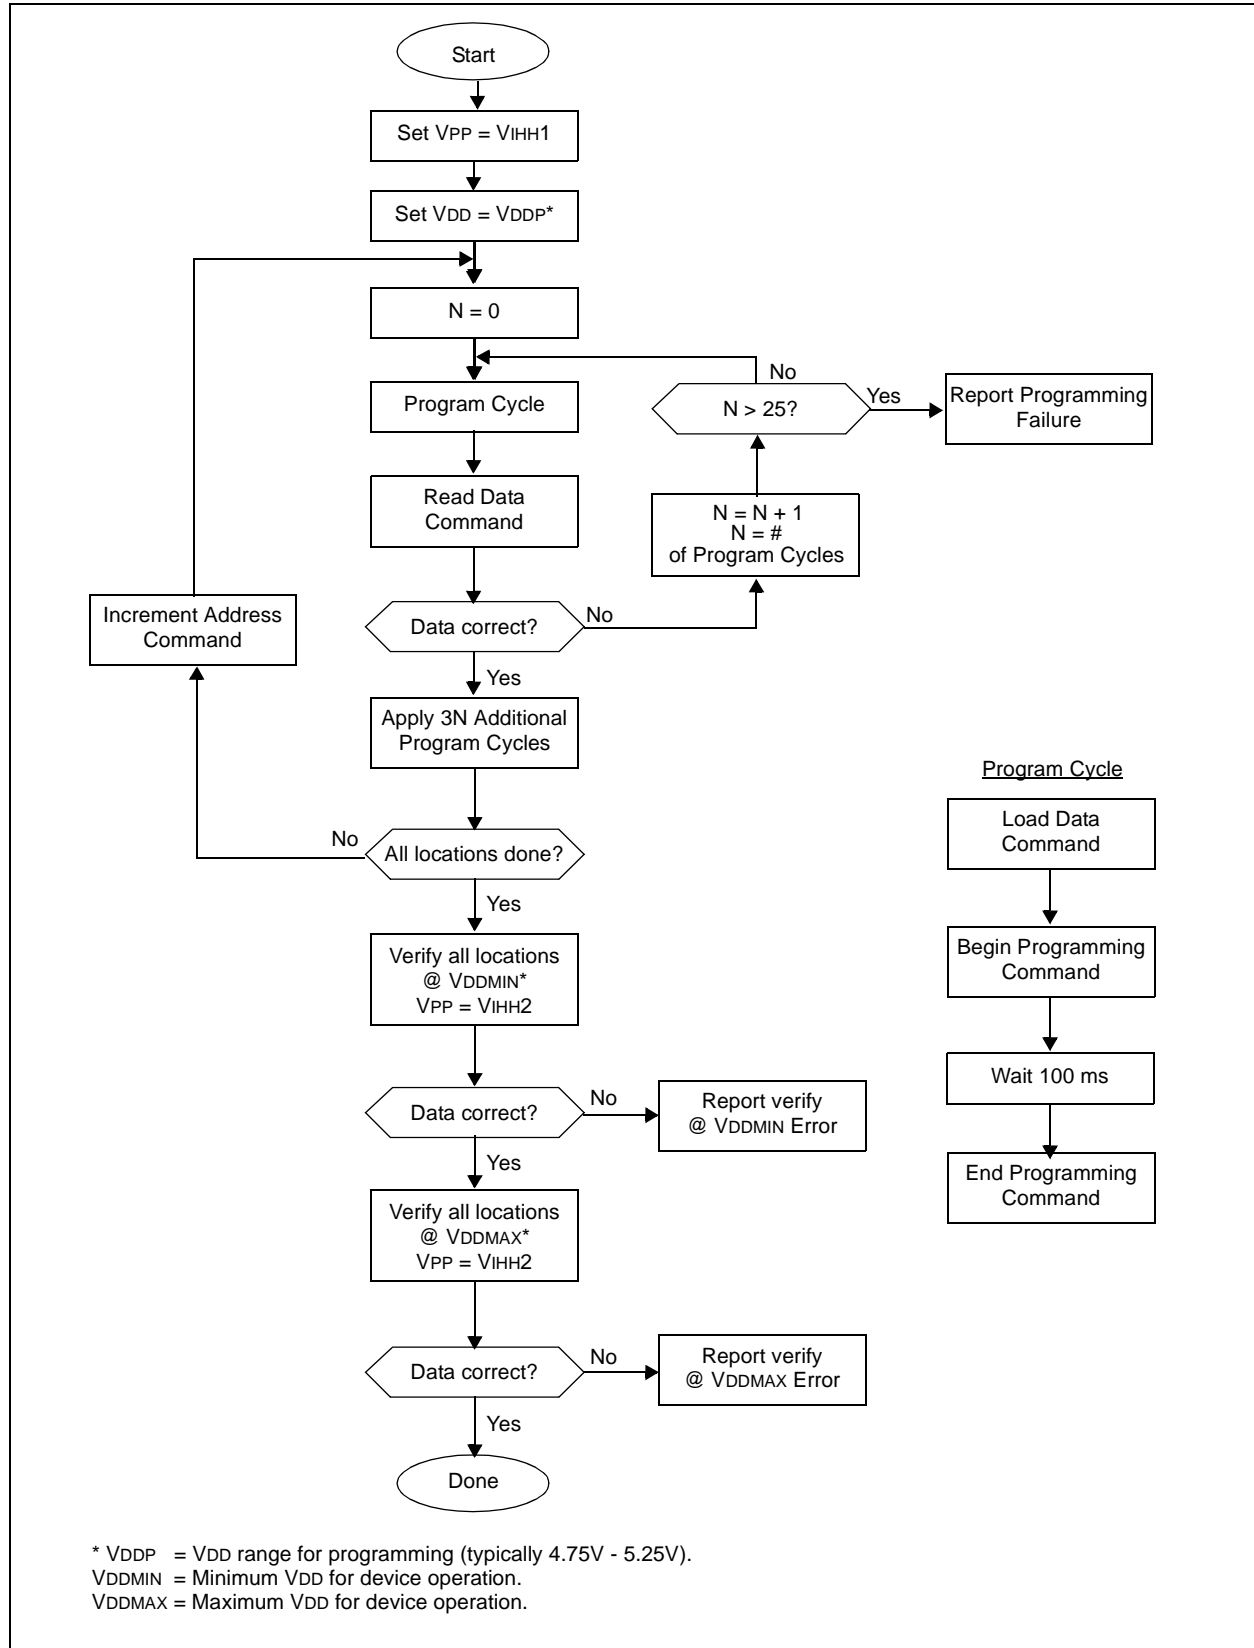

After receiving this command, the program counter (PC) will be set to 0x2000. By then applying 16 cycles to the clock pin, the chip will load 14 bits in a "data word" as described above, to be programmed into the configuration memory. A description of the memory mapping schemes for normal operation and Configuration mode operation is shown in Figure 2-1. After the configuration memory is entered, the only way to get back to the user program memory is to exit the Program/Verify Test mode by taking $\overline{\text{MCLR}}$ low (VIL).

TABLE 2-2: COMMAND MAPPING

Command	Mapping (MSb... LSb)						Data
Load Configuration	0	0	0	0	0	0	0, data(14), 0
Load Data	0	0	0	0	1	0	0, data(14), 0
Read Data	0	0	0	1	0	0	0, data(14), 0
Increment Address	0	0	0	1	1	0	
Begin programming	0	0	1	0	0	0	
End Programming	0	0	1	1	1	0	

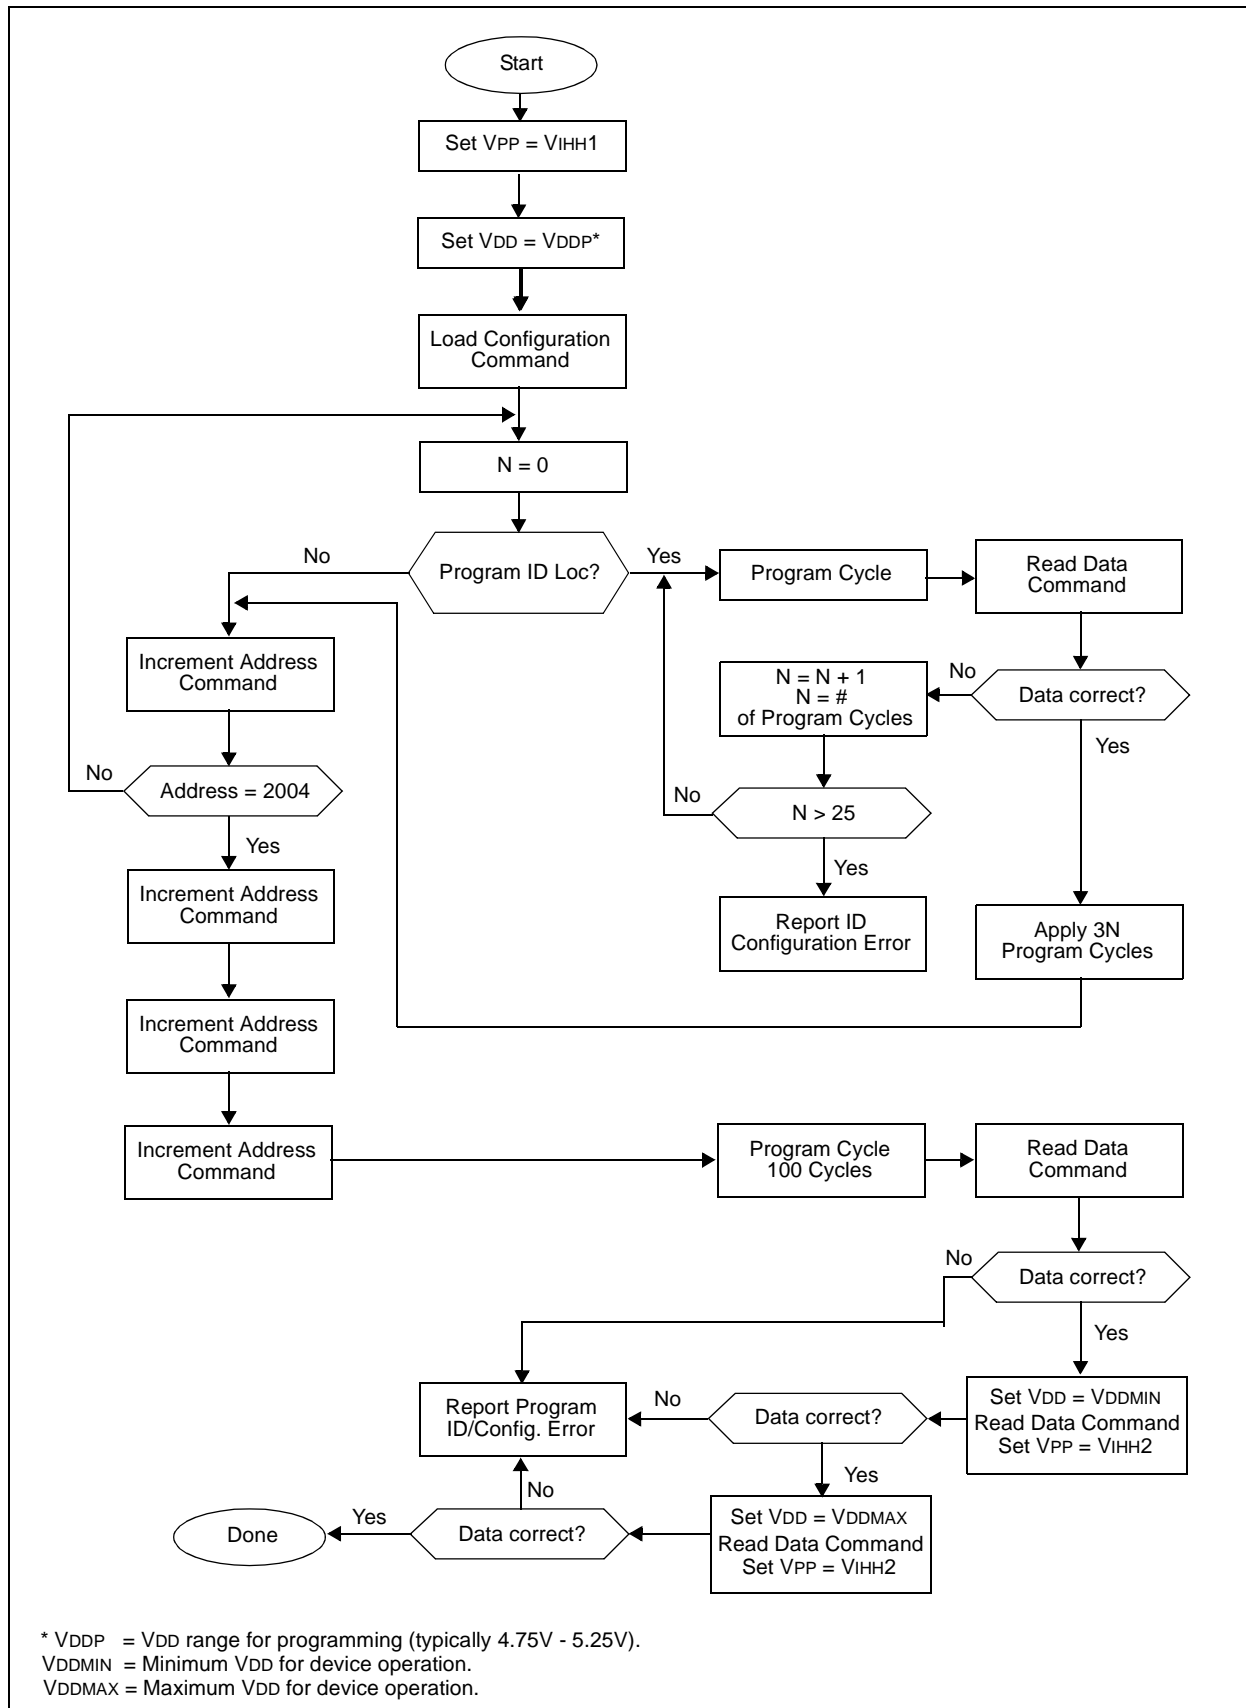

Note: The clock must be disabled during In-Circuit Serial Programming™.

FIGURE 2-2: PROGRAM FLOW CHART - PIC16C7XX PROGRAM MEMORY

PIC16C7XX

FIGURE 2-3: PROGRAM FLOW CHART - PIC16C7XX CONFIGURATION WORD AND ID LOCATIONS

2.2.1.2 Load Data

After receiving this command, the chip will load in a 14-bit “data word” when 16 cycles are applied, as described previously. A timing diagram for the Load Data command is shown in Figure 4-1.

2.2.1.3 Read Data

After receiving this command, the chip will transmit data bits out of the memory currently accessed, starting with the second rising edge of the clock input. The RB7 pin will go into Output mode on the second rising clock edge, and it will revert back to Input mode (hi-impedance) after the 16th rising edge. A timing diagram of this command is shown in Figure 4-2.

2.2.1.4 Increment Address

The PC is incremented when this command is received. A timing diagram of this command is shown in Figure 4-3.

2.2.1.5 Begin Programming

A Load command (Load Configuration or Load Data) must be given before every Begin Programming command. Programming of the appropriate memory (test program memory or user program memory) will begin after this command is received and decoded. Programming should be performed with a series of 100 μ s programming pulses. A programming pulse is defined as the time between the Begin Programming command and the End Programming command.

2.2.1.6 End Programming

After receiving this command, the chip stops programming the memory (configuration program memory or user program memory) that it was programming at the time.

2.3 Programming Algorithm Requires Variable VDD

The PIC16C7XX uses an intelligent algorithm. The algorithm calls for program verification at VDDMIN as well as VDDMAX. Verification at VDDMIN ensures good “erase margin”. Verification at VDDMAX ensures good “program margin.”

The actual programming must be done with VDD in the VDDP range (4.75 - 5.25V).

VDDP = VDD range required during programming.

VDDMIN = minimum operating VDD spec for the part.

VDDMAX = maximum operating VDD spec for the part.

Programmers must verify the PIC16C7XX at its specified VDDMAX and VDDMIN levels. Since Microchip may introduce future versions of the PIC16C7XX with a broader VDD range, it is best that these levels are user selectable (defaults are ok).

Note: Any programmer not meeting these requirements may only be classified as “prototype” or “development” programmer, but not a “production” quality programmer.

PIC16C7XX

3.0 CONFIGURATION WORD

The PIC16C7XX family members have several configuration bits. These bits can be programmed (reads '0'), or left unprogrammed (reads '1'), to select various device configurations. Figure 3-1 provides an overview of configuration bits.

3.1 Device ID Word

The device ID word is located at 2006h.

TABLE 3-1: DEVICE ID VALUE

Device	Device ID Value	
	Dev	Rev
PIC16C717	00 1010 110	x xxxx
PIC16C770	00 1010 111	x xxxx
PIC16C771	00 1011 000	x xxxx
PIC16C781	00 1101 010	x xxxx
PIC16C782	00 1101 011	x xxxx

FIGURE 3-1: CONFIGURATION WORD FOR PIC16C7XX DEVICE (CONFIG: 2007h)

$\overline{\text{CP}}$	$\overline{\text{CP}}$	BORV1	BORV0	$\overline{\text{CP}}$	$\overline{\text{CP}}$	—	BODEN	MCLRE	$\overline{\text{PWRT}}\overline{\text{E}}$	WDTE	FOSC2	FOSC1	FOSC0
bit13	12	11	10	9	8	7	6	5	4	3	2	1	bit0

bit 13-12: **$\overline{\text{CP}}$** : Program Memory Code Protection bits

bit 9-8: 1 = Code protection off
0 = All program memory is protected⁽²⁾

bit 11-10: **BORV<1:0>**: Brown-out Reset Voltage bits
00 = VBOR set to 4.5V
01 = VBOR set to 4.2V
10 = VBOR set to 2.7V
11 = VBOR set to 2.5V

bit 7: **Unimplemented**: Read as '1'

bit 6: **BODEN**: Brown-out Detect Reset Enable bit⁽¹⁾
1 = Brown-out Detect Reset enabled
0 = Brown-out Detect Reset disabled

bit 5: **MCLRE**: RA5/ $\overline{\text{MCLR}}$ Pin Function Select
1 = RA5/ $\overline{\text{MCLR}}$ pin function is $\overline{\text{MCLR}}$
0 = RA5/ $\overline{\text{MCLR}}$ pin function is digital input, $\overline{\text{MCLR}}$ internally tied to VDD

bit 4: **$\overline{\text{PWRT}}\overline{\text{E}}$** : Power-up Timer Enable bit⁽¹⁾
1 = PWRT disabled
0 = PWRT enabled

bit 3: **WDTE**: Watchdog Timer Enable bit
1 = WDT enabled
0 = WDT disabled

bit 2-0: **FOSC<2:0>**: Oscillator Selection bits⁽³⁾
000 = LP oscillator: Ceramic resonator on RA6/OSC2/CLKOUT and RA7/OSC1/CLKIN
001 = XT oscillator: Crystal on RA6/OSC2/CLKOUT and RA7/OSC1/CLKIN
010 = HS oscillator: High frequency crystal on RA6/OSC2/CLKOUT and RA7/OSC1/CLKIN
011 = EC: I/O function on RA6/OSC2/CLKOUT pin, CLKIN function on RA7/OSC1/CLKIN
100 = INTRC oscillator: I/O function on RA6/OSC2/CLKOUT pin, I/O function on RA7/OSC1/CLKIN
101 = INTRC oscillator: CLKOUT function on RA6/OSC2/CLKOUT pin, I/O function on RA7/OSC1/CLKIN
110 = ER oscillator: I/O function on RA6/OSC2/CLKOUT pin, Resistor on RA7/OSC1/CLKIN⁽⁴⁾
111 = ER oscillator: CLKOUT function on RA6/OSC2/CLKOUT pin, Resistor on RA7/OSC1/CLKIN⁽⁴⁾

Note 1: PIC16C771/770: Enabling Brown-out Reset automatically enables the Power-up Timer (PWRT), regardless of the value of bit $\overline{\text{PWRT}}\overline{\text{E}}$. Ensure the Power-up Timer is enabled any time Brown-out Reset is enabled.

PIC16C781/782: Brown-out Reset and Power-up Timer (PWRT) operate independently.

2: All of the CP bits must be given the same value to enable code protection.

3: When the internal oscillator is selected (INTRC or ER), and the part is in RESET, the oscillator is disabled and CLKOUT is held low.

4: PIC16C717/770/771 has ER modes; PIC16C781/782 has external RC modes.

PIC16C7XX

3.2 Embedding Configuration Word and ID Information in the HEX File

To allow portability of code, the programmer is required to read the configuration word and ID locations from the HEX file when loading the HEX file. If configuration word information was not present in the HEX file, then a simple warning message may be issued. Similarly, while saving a HEX file, configuration word and ID information must be included. An option to not include this information may be provided.

Microchip Technology Inc. feels strongly that this feature is beneficial to the end customer.

3.3 Checksum

3.3.1 CHECKSUM CALCULATIONS

Checksum is calculated by reading the contents of the PIC16C7XX memory locations and adding up the opcodes up to the maximum user addressable location (e.g., 0-0xFFF for the PIC16C771). Any carry bits exceeding 16 bits are neglected. Finally, the configuration word (appropriately masked) is added to the checksum. Checksum computation for each member of the PIC16C7XX devices is shown in Table 3-2.

The checksum is calculated by summing the following:

- The contents of all program memory locations
- The configuration word, appropriately masked
- Masked ID locations (when applicable)

The Least Significant 16 bits of this sum are the checksum.

The following table describes how to calculate the checksum for each device. Note that the checksum calculation differs depending on the code protect setting. Since the program memory locations read out differently depending on the code protect setting, the table describes how to manipulate the actual program memory values to simulate the values that would be read from a protected device. When calculating a checksum by reading a device, the entire program memory can simply be read and summed. The configuration word and ID locations can always be read.

Note that some older devices have an additional value added in the checksum. This is to maintain compatibility with older device programmer checksums.

TABLE 3-2: CHECKSUM COMPUTATION

Device	Code Protect	Checksum*	Blank Value	0x25E6 at 0 and max address
PIC16C717	OFF ALL	SUM[0x000:0x07FF] + CFGW & 0x3F7F CFGW & 0x3F7F + SUM_ID	0x377F 0x43FE	0x034D 0x0FCC
PIC16C770	OFF ALL	SUM[0x000:0x07FF] + CFGW & 0x3F7F CFGW & 0x3F7F + SUM_ID	0x377F 0x43FE	0x034D 0x0FCC
PIC16C771	OFF ALL	SUM[0x000:0x0FFF] + CFGW & 0x3F7F CFGW & 0x3F7F + SUM_ID	0x2F7F 0x3BFE	0xFB4D 0x07CC
PIC16C781	OFF ALL	SUM[0x000:0x03FF] + CFGW & 0x3F7F CFGW & 3F7F + SUM_ID	0x3B7F 0x47FE	0x074D 0x13CC
PIC16C782	OFF ALL	SUM[0x000:0x07FF] + CFGW & 0x3F7F CFGW & 0x3F7F + SUM_ID	0x377F 0x43FE	0x034D 0x0FCC

Legend: CFGW = Configuration Word

SUM[a:b] = [Sum of locations a through b inclusive]

SUM_XNOR7[a:b] = XNOR of the seven high order bits of memory location with the seven low order bits summed over locations a through b inclusive. For example, XNOR(0x3C31)=0x78
XNOR 0c31 = 0x0036.

SUM_ID = ID locations masked by 0xF then made into a 16-bit value with ID0 as the Most Significant nibble. For example, ID0 = 0x12, ID1 = 0x37, ID2 = 0x4, ID3 = 0x26, then SUM_ID = 0x2746.

*Checksum = [Sum of all the individual expressions] **MODULO** [0xFFFF]

+ = Addition

& = Bitwise AND

| = Bitwise OR

4.0 PROGRAM/VERIFY MODE

TABLE 4-1: AC/DC CHARACTERISTICS
TIMING REQUIREMENTS FOR PROGRAM/VERIFY TEST MODE

Standard Operating Conditions							
Operating Temperature: $+10^{\circ}\text{C} \leq T_A \leq +40^{\circ}\text{C}$, unless otherwise stated (20°C recommended)							
Operating Voltage: $4.5\text{V} \leq V_{DD} \leq 5.5\text{V}$, unless otherwise stated							
Parameter No.	Sym.	Characteristic	Min.	Typ.	Max.	Units	Conditions
General							
PD1	VDDP	Supply voltage during programming	4.75	5.0	5.25	V	
PD2	IDDP	Supply current (from VDD) during programming	–	–	20	mA	
PD3	VDDV	Supply voltage during verify	VDDMIN	–	VDDMAX	V	(Note 1)
PD4	VIHH1	Voltage on $\overline{\text{MCLR}}/\text{VPP}$ during programming	12.75	–	13.25	V	(Note 2)
PD5	VIHH2	Voltage on $\overline{\text{MCLR}}/\text{VPP}$ during verify	VDD + 4.0	–	13.25	–	
PD6	I _{PP}	Programming supply current (from VPP)	–	–	50	mA	
PD9	V _{IH}	(RB6, RB7) input high level	0.8 VDD	–	–	V	Schmitt Trigger input
PD8	V _{IL}	(RB6, RB7) input low level	–	–	0.2 VDD	V	Schmitt Trigger input
Serial Program Verify							
P1	TR	$\overline{\text{MCLR}}/\text{VPP}$ rise time (VSS to VIHH) for Test mode entry	–	–	8.0	μs	
P2	Tf	$\overline{\text{MCLR}}$ fall time	–	–	8.0	μs	
P3	Tset1	Data in setup time before clock ↓	100	–	–	ns	
P4	Thd1	Data in hold time after clock ↓	100	–	–	ns	
P5	Tdly1	Data input not driven to next clock input (delay required between command/data or command/command)	1.0	–	–	μs	
P6	Tdly2	Delay between clock ↓ to clock ↑ of next command or data	1.0	–	–	μs	
P7	Tdly3	Clock ↑ to data out valid (during read data)	200	–	–	ns	
P8	Thld0	Hold time after $\overline{\text{MCLR}}$ ↑	2	–	–	μs	
P9	TPPDP	Hold time after VPP ↑	5			μs	

Note 1: Program must be verified at the minimum and maximum VDD limits for the part.

Note 2: VIHH must be greater than VDD + 4.0V to stay in Programming/Verify mode.

PIC16C7XX

FIGURE 4-1: LOAD DATA COMMAND (PROGRAM/VERIFY)

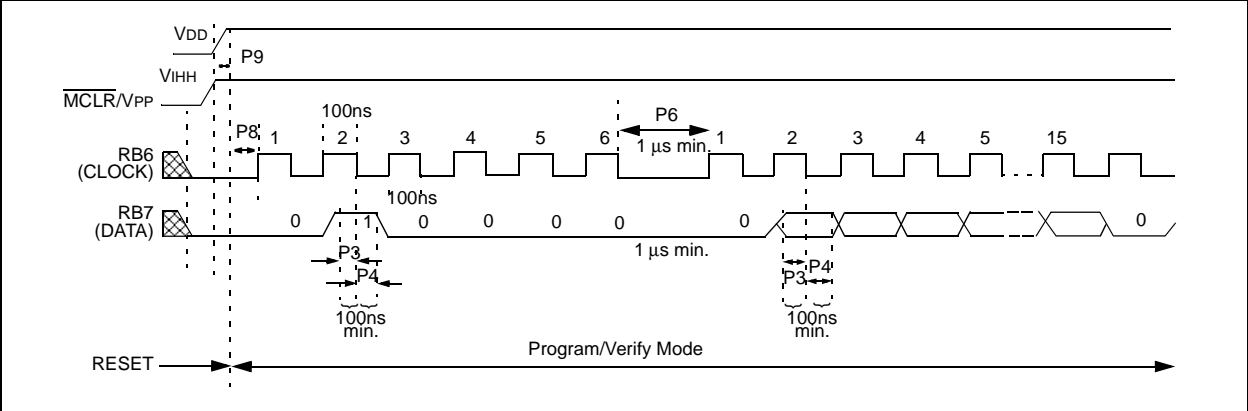

FIGURE 4-2: READ DATA COMMAND (PROGRAM/VERIFY)

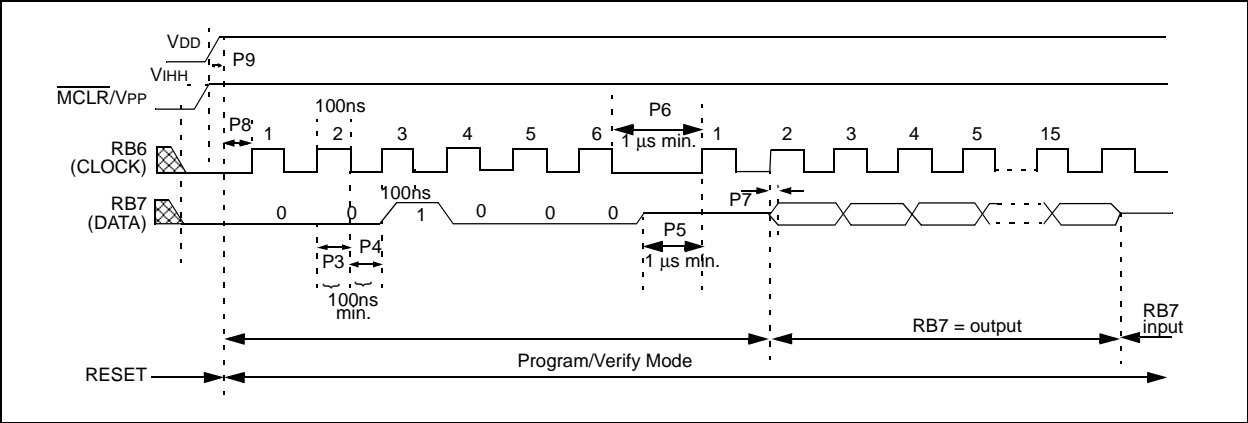

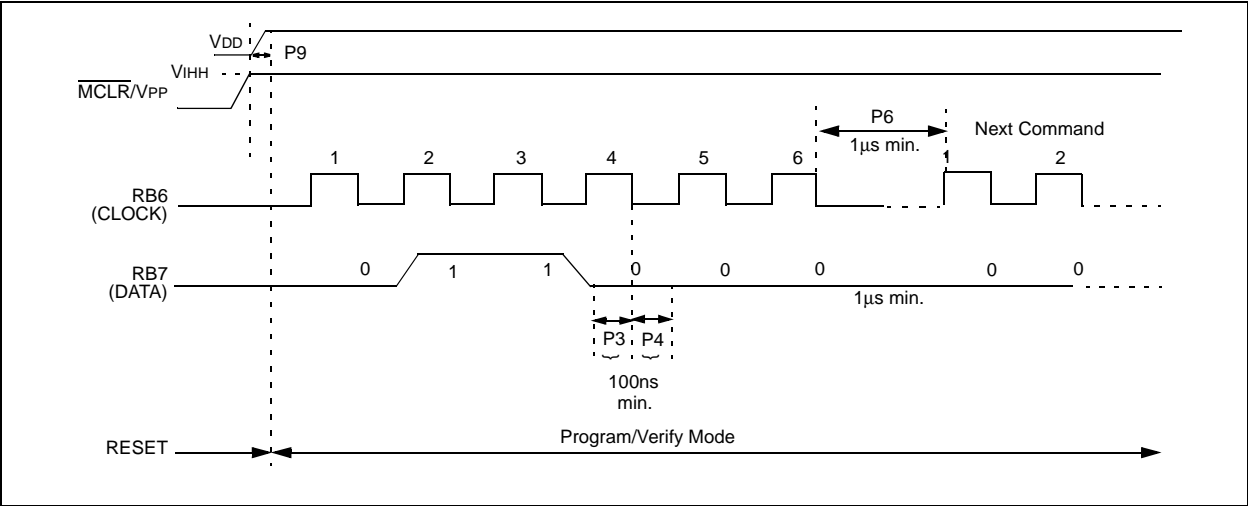

FIGURE 4-3: INCREMENT ADDRESS COMMAND (PROGRAM/VERIFY)

Note the following details of the code protection feature on PICmicro® MCUs.

- The PICmicro family meets the specifications contained in the Microchip Data Sheet.
- Microchip believes that its family of PICmicro microcontrollers is one of the most secure products of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the PICmicro microcontroller in a manner outside the operating specifications contained in the data sheet. The person doing so may be engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable”.
- Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our product.

If you have any further questions about this matter, please contact the local sales office nearest to you.

Information contained in this publication regarding device applications and the like is intended through suggestion only and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. No representation or warranty is given and no liability is assumed by Microchip Technology Incorporated with respect to the accuracy or use of such information, or infringement of patents or other intellectual property rights arising from such use or otherwise. Use of Microchip's products as critical components in life support systems is not authorized except with express written approval by Microchip. No licenses are conveyed, implicitly or otherwise, under any intellectual property rights.

Trademarks

The Microchip name and logo, the Microchip logo, FilterLab, KEELOQ, microID, MPLAB, PIC, PICmicro, PICMASTER, PICSTART, PRO MATE, SEEVAL and The Embedded Control Solutions Company are registered trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.
